ASSESSMENTS

Eliminate the guesswork

Identify technical skill gaps instantly

Having the right tech talent is essential for any company to thrive in today's cloud-native world — and finding the right people in the open market is both unpredictable and expensive. We've all been there — working with recruiters for months to identify someone with the right mix of technical and interpersonal abilities, only then having to onboard and train them before they know your tech stack, your business, and before they can produce.

There's a much easier, more structured, and cost-effective way to ensure you have the talent with the skills that are right for you. And you can get this by investing in and developing the skills of your current team. Not only does this shed light on what skills you already have in-house (tech people are multidimensional, after all), but it also makes the journey more predictable and allows you to better engage and retain high-performing individuals.

Sounds great, right? Here's how to make that happen.

DEVELOP

Build Hands-On Tech Skills With Precision

Uplevel technical capabilities with an all-in-one training solution

Most skill development platforms are similar to a free gym membership — offered to employees as a benefit that results in low usage rates and zero impact on the business. It's simple — making your tech team watch a video and pass a basic quiz does not mean they have the hands-on skills needed to take your company to the next level.

That's where we come in. After using Cloud Academy to assess the current skills of your tech talent, it's now time to upskill them based on the skills or roles you need and the business outcomes you desire. And the best part? It's all predictable. Cloud Academy predictably builds tech skills based on reality, and we show you the results in real time. So you know exactly where your team's at, and what they're capable of.

Read on to learn how.

VALIDATE

Know exactly when your team is ready

Make decisions with confidence about the talent on your team

Just like your company has a CRM to track its customers and prospects, it also needs a system to catalog the skills and development of teams — especially regarding technical talent that is critical to maintaining a competitive advantage. Cloud Academy streamlines the success of your digital transformation journey by providing the tools for tailoring and measuring skills in a scalable and predictable way.

Tech Skills 2022: THE MUST-HAVES

The tech world is constantly evolving, and it's changed a lot over the last couple of years. That means your business – and especially your tech teams – need to keep up or risk being left behind.

Cloud Computing

Salary Range: \$83k-167k

Positions in cloud computing can include Cloud Solutions Engineers and Cloud Architects. People in these roles are vital to the creation, implementation, and maintenance of strategic cloud adoption plans.

Here are some qualities a great potential cloud computing pro may have:

Background: IT, networking, or engineering
Current Skills: Strong understanding of IT, networking, or engineering
Upskilling Path: Get administrative experience with today's biggest cloud service providers (like Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Alibaba Cloud), their products, configurations, and cost optimization; gain an understanding of the cloud landscape to accurately weigh the pros and cons of SaaS/IaaS/PaaS providers and guide your team's cloud transitions long-term.

Google Cloud Platform for Solution Architects
Microsoft Azure for Solution Architects
AWS Solutions Architect - Associate Certification Preparation for AWS

DevOps / Software Engineering

Salary Range: \$90k-150k

Positions in DevOps can include DevOps Engineers, Senior Analysts, and Managers. People in this role help manage the development, deployment, and operation of high-quality software by facilitating the exchange of information, shortening and amplifying feedback loops, and fostering a culture of strong cross-team collaboration.

DevOps isn't new to the tech world, but its tools are constantly changing. Someone who's itching to stay stimulated at work could be a great DevOps practitioner if they have this experience:

Background: Software engineering, software project management. May come from a computer science/software development background
Current Skills: Soft interpersonal, tooling, project management, and technical skill, strong coding and software design skills and problem-solving ability through program designs
Upskilling Path: Become familiar with the concepts of source control continuous integration, and continuous delivery, as well as related tools and tech; gain an understanding of the mindset, frameworks, and processes of Agile methodology; get experience with Git

Big Data and AI/ML

Salary Range: \$90k-120k

Positions in data science can include Machine Learning Engineers, Artificial Intelligence Architects, Business Intelligence Engineers, Natural Language Processing Engineers, and Data Science Engineers. People in these roles are essential for managing large quantities of data for artificial intelligence, machine learning, analytics, and other big data applications.

Someone may be a rockstar data scientist if they have the background and current skills listed below:

Background: Computer science, software engineering, cognitive science, or business analysis
Current Skills: strong data architecture, coding, math, and problem-solving skills
Upskilling Path: get experience optimizing storage and handling big data in cloud environments; gain an understanding of the various potential data-handling solutions and their pros and cons, as well as configurations

Application Development

Salary Range: \$80k-120k

Positions in application development can include Developers, Software Engineers, DevOps Engineers, Product Managers, and Software Architects. People in these roles create beautiful designs, code, and build applications to drive business value - which is especially important in today's booming Continuous Integration/Continuous Delivery (CI/CD) environment.

Someone may be great in application development if they have these qualities:

Background: Computer science, software development, IT, or software project management
Current Skills: Strong understanding of coding and software design, problem-solving skills, and project management skills
Upskilling Path: Gain an understanding of current cloud-based tools, containers, and microservices development; get experience building tools to create and automate modern DevOps processes; become familiar with collaborative tools (like Jira and Git)
